

Arrays in PHP

Can be used as traditional arrays

hashes

1st Case: subscript is integer index

2nd case: subscript is key value

Explicitly: `array()`

Implicitly: indexing a variable

Accessing:

Directly: provide key, retrieve value

Resemble Linked Lists

sequential access follows linked list

foreach is over order in which it was generated

data in array is not contiguous

`showa($_), showb($_), print_r($_)`

`sort()`

- #'s numerically
- strings alphabetically

`asort()`

- keeps original key values
